

## The Field In My Garden

(Depth of Field Close Up)

Why this subject?

f7.1 100mm APS

f8 100mm APS

f14 100mm APS

Old lenses often included a scale that showed linked f-number to the nearest and furthest distance that would be “in focus”

i.e. the depth of field.

In this example with the lens set at 50mm and f8, and the focus point at 0.61m, the near and far points in focus are approximately 0.59m and 0.63m. Increasing the f-number to f22 would change the near and far points to approximately 0.53m and 0.72m.

However, new lenses don't include this helpful feature....

## Depth of Field:— an equation from Wikipedia

Back to basics: circle of confusion

The depth of field is the region where the CoC is less than the resolution of the human eye (or the display medium).

This is often taken as 5 lines per mm.

Based on a 30cm (across corners) print, at 25cm viewing distance this gives the following:

4/3rds sensor 0.015

APS sensor 0.018 / 0.019

35mm sensor 0.029

$$\text{DOF} = \frac{2 N c f^2 s^2}{f^4 - N^2 c^2 s^2}$$

where

|   |                               |
|---|-------------------------------|
| f | focal length of the lens (mm) |
| N | f-Number                      |
| s | subject distance (mm)         |
| c | circle of confusion (mm)      |

*Examples:*      f=35    N=11    s=300    c=0.02

DOF = 32mm

Changing the lens from 35mm to f=100mm

DOF = 4mm

doubling the aperture from 11 to N=22

DOF = 8mm

Equivalent DOF for different sensors using aperture:

4/3rds sensor      f1.9

APS sensor      f2.8

35mm sensor      f4

No maths required – a depth of field calculator can be put on your phone/computer.....

*2 examples*
